

EXECUTIVE SUMMARY

Data Management & Analytics Assessment

The Embassy Outreach Database contains **88 outreach records representing 85 unique non-blank Embassy IDs**. Overall outreach activity is mixed, with **22 embassies classified as Engaged and 14 as In Discussion**, giving an active engagement rate of **40.9% across the source records**. A further **15 records are at the Initial Contact Made stage**, while **11 are Meeting Scheduled, 11 are On Hold, 10 are Not Started and 5 are Closed**. In total, **32 records are either Not Started, On Hold or Meeting Scheduled**, indicating a meaningful group requiring continued follow-up or action.

Regional engagement varies. **Sub-Saharan Africa has the highest active engagement rate at 56.3%**, followed by **Middle East & North Africa at 50.0%** and **Asia-Pacific at 46.7%**. Europe and America have lower active engagement rates of **36.8% and 35.7% respectively**, while South & Central Asia has **28.6%**. **Five records have no regional classification**, limiting the completeness of regional reporting.

The database contains several data-quality gaps that may affect reporting and operational decision-making. Missing information includes **21 Engagement Levels, 22 Next Follow-up Dates, 8 Outreach Owners, 7 Email addresses, 8 Phone numbers, 10 First Contact Dates, 11 Last Contact Dates, 6 Interaction counts, 10 Channels, 5 Regions and 2 Embassy IDs**. There are also **6 malformed email addresses, 5 incomplete phone numbers and one negative interaction value (-3)**.

Several logical inconsistencies require verification. **Seven records contain chronological conflicts between contact dates**, and three Last Contact Dates are future-dated relative to the assessment timeline. There is also **one duplicated Embassy ID (EMB-037)** and several records that appear to represent possible duplicate or updated entries and therefore require source verification. Status values also contain inconsistent variations and should be standardised for reporting.

Recommendations

Management should prioritise records with missing or overdue follow-up information, particularly the **22 records without a Next Follow-up Date**. Ownership should also be clarified for the **8 records without an Outreach Owner**. Engagement Level, contact details and interaction records should be completed or verified before being relied upon for performance reporting.

A standardised data-entry framework should be introduced for status, region, channel, email, phone and date fields. The raw source data should be preserved, while data-quality issues and any subsequent corrections should be documented through an audit trail. Finally, regular data-quality checks should be incorporated into the outreach-management process so that dashboard reporting remains reliable and actionable.

AI EXERCISE

AI Tool Used

OpenAI ChatGPT

Prompts Used

Prompt 1:

“Scan all the documents carefully first and identify the requirements of the Data Management & Analytics Assessment.”

Prompt 2:

“Review the Embassy Outreach Database and identify missing values, duplicates, inconsistencies, malformed contact information, date issues, and logical contradictions. Perform multiple validation scans.”

Prompt 3:

“Analyse the database and determine suitable leadership dashboard metrics covering outreach status, engagement, regional performance, data-quality gaps and areas requiring management attention.”

Prompt 4:

“Cross-check the dashboard calculations against the backend data and identify any incorrect formulas, inconsistent ranges, missing categories or misleading metrics.”

How AI Assisted the Analysis

AI was used as an analytical support tool to structure the review of the raw Embassy Outreach Database and identify patterns that could affect reporting and decision-making. The analysis included checks for missing information, duplicate identifiers, inconsistent status and region labels, invalid contact information,

date-format and chronological issues, invalid numerical values, and contradictions between outreach status, interactions and remarks.

AI was also used to develop and validate management-focused metrics for the dashboard, including outreach-status distribution, active engagement rate, regional engagement, engagement-level completeness and records requiring attention.

The AI-generated findings were **cross-checked against the source workbook before being incorporated into the analysis**. Missing or uncertain information was not treated as corrected data; instead, it was flagged for verification.

Key Insights and Recommendations Generated Through AI

The analysis identified several areas requiring management attention:

- **22 records have no Next Follow-up Date**, creating a potential tracking and follow-up gap.
- **21 records have no Engagement Level**, limiting the completeness of engagement reporting.
- **8 records have no Outreach Owner**, creating an accountability gap.
- **5 records have no Region**, affecting regional comparisons.
- **One negative interaction count** was identified and requires verification.
- Several contact details and dates require validation before being relied upon operationally.
- Status and regional labels should be standardised for consistent dashboard reporting.
- Duplicate or potentially updated embassy records should be reconciled rather than silently deleted.
- The original raw dataset should be retained unchanged, with any analytical standardisation or corrections documented separately.

The overall recommendation is to use the dashboard not only as a reporting tool but also as an **operational management view**, with attention focused on records requiring follow-up, ownership, data completion and verification.

Validation Approach

The analysis was subject to repeated checks covering:

1. Assignment requirements and deliverables
2. Workbook structure and sheet completeness

3. Dashboard KPI formulas
4. Outreach-status reconciliation
5. Regional totals and engagement calculations
6. Engagement-level completeness
7. Management-attention metrics
8. Backend missing-value analysis
9. Data validity and logical consistency
10. Dashboard and Data Quality Review cross-checking
